

FinTrust Week 2 Project Summary

1. What was planned

Move from Week 1 planning into practical data preparation, SQL analysis, Python EDA and dashboard preparation.

2. What was completed

Excel data-quality workbook, 10 SQL business questions with results and interpretations, Python EDA notebook with six visuals, Power BI measures/build guide and dashboard wireframe, five business findings, testing log and documentation.

3. Tools used

Excel-compatible workbook, SQL/SQLite-compatible scripts, Python, Pandas, NumPy, Matplotlib, Seaborn, Jupyter Notebook format, Power BI build specification.

4. Key findings

Mobile App is the most-used channel; Cash Withdrawal has the highest transaction value; the transaction amount distribution is right-skewed; Everyday is the largest visible customer segment; the customer/transaction join is not reliable.

5. Major challenges

Only one transaction Customer_ID matched the visible customer export. Transaction status and risk-review fields were not present in the supplied transaction export. Several customer fields defined in the dictionary were absent from the visible export.

6. Important decisions

No unsupported fields were invented; no outliers were deleted automatically; customer-level transaction analysis was gated pending key validation.

7. Changes from Week 1

The dashboard plan was narrowed to supported KPIs and a visible data-quality section. Customer-level transaction views were deferred until the join is validated.

8. Testing performed

Missing/duplicate checks, key join validation, data-type review, IQR outlier review, cross-checking analytical summaries and KPI field availability.

9. Key limitations

Small synthetic sample, one visible date/time window, incomplete join, missing status/risk fields and missing dictionary-defined customer attributes in the export.

10. Remaining work

Build the actual Power BI .pbix manually in Power BI Desktop; validate source relationship and obtain complete fields; refresh customer-level analytics.

11. Week 3 focus

Resolve data-source issues, build the management dashboard, validate visuals and KPI definitions, and strengthen the business narrative.
